

# The ultimate guide to becoming a PRINCE2 Agile practitioner

To become a practitioner, a candidate has to complete his or her foundation level certification. The AXELOS follows a ladder approach for all of its certification. And PRINCE2 Agile certification is not an exception. To start with this certification, you have to complete your PRINCE2 certification as PRINCE2 Agile is an extension of the PRINCE2 certificate. You must be clear with the goals set by AXELOS as to what it looks into a professional who is a certified PRINCE2 Agile practitioner.

## **The Ladder Approach**

The [PRINCE2 certification](#) is designed for project management with the growing popularity of Agile methodology is Agile management the AXELOS has brought in a new aspect puts project management credentials in the form of Prince 2 Agile certification. The certification further follows two levels, and they are:

- foundation level
- practitioner level

The foundation level training consists of a consolidated and intensive three days training program by an accredited training organization recognized by AEXELOS. In layman's terms, this is the marriage of PRINCE2 and Agile.

You learn about the official guidance in the foundation certification. The ability to deliver value to the customer is strengthened earlier in the PRINCE2 certificate but with Agile certified professional knows about the iterative and incremental approaches by avoiding wasted efforts in the current iteration.

The principles from Prince to foundation forms the building blocks at the practitioner level. The themes & process are remaining the same, but a practitioner is taught about tailoring every project in an Agile environment.

## **The Ultimate Guide**

Out of the total 1,000,000 PRINCE2 certified professionals, more than 437 thousand professionals are holding foundation certification. Having a practitioner level certification not

only increases your visibility but also makes you an expert in the project management domain. The certificate is also about managing social expectations along with IT advancements. The practitioner level certification inculcates the forward-thinking attitude in any individual who can take a significant risk in introducing best practices, standard methods, tools, and technologies of both Agile as well as PRINCE2 book of knowledge.

Equipping with this certification enhances professional knowledge, my expertise, and capabilities to reach and adapt but seamless integration. To be a practitioner, you have to earn at least one year of Agile experience in project management after completion of the foundation certification. Although there is no hard and fast rule to be on the safer side, experts recommend certified professionals who have experience in Agile management before they sit for this advanced-level certification.

With the knowledge gained from the foundation certification, you need to apply or implement in getting combined flexibility and responsiveness of Agile in context to delivery and successful compilation of projects. You have also required the focus more on stakeholder management after your foundation level certification is completed. The skills you gathered through the delivery of projects and meeting customers' requirements will benefit you further at the practitioner level.

I like the foundation level. The certification exam is an open book examination that spans 150 minutes. The test is available in four languages, and you have to secure 60% the successfully passed the examination. The certification is valid for three years, and after that, you have to reset for the test to maintain its validity through AEXELOS membership.

As a practitioner level aspirant, you have to work on your preparation. You start your practice by revisiting the lessons learned at the foundation level. You get 50 scenario-based multiple-choice questions in this examination.

About 20% of all the questions are focused on areas of PRINCE2 Agile like:

- the Agilometer
- requirements
- rich communication
- frequent releases
- contracts

While 75% of all the items are based on tailoring, tailoring is all about Agile awareness that is natural to the standards set by the [Agile manifesto](#). To clear this certification in one go, you have

to focus more on the tailoring part. This includes post-project benefits or business values planning for receiving feedback from the market, users, and customers making checkpoint report her presentation of information radiator you have to be very much specific about hard code tailoring applied methodologies in the product description or responsibility tables.

## **Conclusion**

When you have cleared your foundation level certification, then removing this practitioner level is not an Everest task. That is the reason that experts recommend to have a clear cut understanding with real-time experience of applications of the knowledge. As a practitioner, you are expected to be a change initiator and a potential risk-taker upon whom the organization can depend.
